

THE CONVERSE ENVELOPE THEOREM

Ludvig Sinander
University of Oxford

19 July 2023

paper: doi.org/10.3982/ECTA18119

Envelope theorem: optimal decision-making \implies \boxtimes formula.

Textbook intuition: \boxtimes formula \iff FOC.

Modern envelope theorem of MS02:* almost no assumptions.

\hookrightarrow FOC ill-defined, so need different intuition.

*Milgrom, P., & Segal, I. (2002). Envelope theorems for arbitrary choice sets. *Econometrica*, 70(2), 583–601. <https://doi.org/10.1111/1468-0262.00296>

Envelope theorem: optimal decision-making \implies \boxtimes formula.

Textbook intuition: \boxtimes formula \iff FOC.

Modern envelope theorem of MS02:* almost no assumptions.

\hookrightarrow FOC ill-defined, so need different intuition.

My theorem: with almost no assumptions,
 \boxtimes formula equivalent to generalised FOC.

– an envelope theorem: FOC \implies \boxtimes

– *a converse*: $\boxtimes \implies$ FOC.

*Milgrom, P., & Segal, I. (2002). Envelope theorems for arbitrary choice sets. *Econometrica*, 70(2), 583–601. <https://doi.org/10.1111/1468-0262.00296>

My theorem: with almost no assumptions,
 \boxtimes formula equivalent to generalised FOC.

– an envelope theorem: FOC \implies \boxtimes

– *a converse*: $\boxtimes \implies$ FOC.

Application to mechanism design.

*Milgrom, P., & Segal, I. (2002). Envelope theorems for arbitrary choice sets. *Econometrica*, 70(2), 583–601. <https://doi.org/10.1111/1468-0262.00296>

Setting

Agent chooses action x from a set \mathcal{X} .

Objective $f(x, t)$, where $t \in [0, 1]$ is a parameter.

No assumptions on \mathcal{X} , almost none on f :

(1) $f(x, \cdot)$ differentiable for each $x \in \mathcal{X}$

(2) $\{f(x, \cdot)\}_{x \in \mathcal{X}}$ absolutely equi-continuous. (def'n: slide 17)

Setting

Agent chooses action x from a set \mathcal{X} .

Objective $f(x, t)$, where $t \in [0, 1]$ is a parameter.

No assumptions on \mathcal{X} , almost none on f :

(1) $f(x, \cdot)$ differentiable for each $x \in \mathcal{X}$

(2) $\{f(x, \cdot)\}_{x \in \mathcal{X}}$ absolutely equi-continuous. (def'n: slide 17)

– a sufficient condition (maintained by MS02):

(a) $f(x, \cdot)$ absolutely continuous $\forall x \in \mathcal{X}$, and

(b) $t \mapsto \sup_{x \in \mathcal{X}} |f_2(x, t)|$ dominated by an integrable f'n.

– a stronger sufficient condition: f_2 bounded.

Setting

Agent chooses action x from a set \mathcal{X} .

Objective $f(x, t)$, where $t \in [0, 1]$ is a parameter.

No assumptions on \mathcal{X} , almost none on f :

(1) $f(x, \cdot)$ differentiable for each $x \in \mathcal{X}$

(2) $\{f(x, \cdot)\}_{x \in \mathcal{X}}$ absolutely equi-continuous. (def'n: slide 17)

– a sufficient condition (maintained by MS02):

(a) $f(x, \cdot)$ absolutely continuous $\forall x \in \mathcal{X}$, and

(b) $t \mapsto \sup_{x \in \mathcal{X}} |f_2(x, t)|$ dominated by an integrable f'n.

– a stronger sufficient condition: f_2 bounded.

Decision rule: a map $X : [0, 1] \rightarrow \mathcal{X}$.

Associated value function: $V_X(t) := f(X(t), t)$.

Envelope theorem

X satisfies the \boxtimes formula iff

$$V_X(t) = V_X(0) + \int_0^t f_2(X(s), s) ds \quad \text{for every } t \in [0, 1].$$

Equivalently: V_X is absolutely continuous and

$$V_X'(t) = f_2(X(t), t) \quad \text{for a.e. } t \in (0, 1).$$

Envelope theorem

X satisfies the \boxtimes formula iff

$$V_X(t) = V_X(0) + \int_0^t f_2(X(s), s) ds \quad \text{for every } t \in [0, 1].$$

Equivalently: V_X is absolutely continuous and

$$V_X'(t) = f_2(X(t), t) \quad \text{for a.e. } t \in (0, 1).$$

X is optimal iff for every t , $X(t)$ maximises $f(\cdot, t)$.

Modern envelope theorem (MS02).[†]

Any optimal decision rule satisfies the \boxtimes formula.

[†]Really a slight refinement of MS02.

Textbook intuition

Differentiation identity for $V_X(t) := f(X(t), t)$:

$$V'_X(t) = \underbrace{\frac{d}{dm} f(X(t+m), t) \Big|_{m=0}}_{\text{'indirect effect'}} + \underbrace{f_2(X(t), t)}_{\text{'direct effect'}}.$$

Indirect effect: t 's gain from mimicking $t+m$ (for small m).

Textbook intuition

Differentiation identity for $V_X(t) := f(X(t), t)$:

$$V'_X(t) = \underbrace{\frac{d}{dm} f(X(t+m), t) \Big|_{m=0}}_{\text{'indirect effect'}} + \underbrace{f_2(X(t), t)}_{\text{'direct effect'}}.$$

Indirect effect: t 's gain from mimicking $t+m$ (for small m).

$$\text{indirect effect} = 0 \quad (\text{FOC})$$

$$\iff V'_X(t) = \text{direct effect} \quad (\boxtimes \text{ formula}).$$

Textbook intuition

Differentiation identity for $V_X(t) := f(X(t), t)$:

$$V'_X(t) = \underbrace{\frac{d}{dm} f(X(t+m), t) \Big|_{m=0}}_{\text{'indirect effect'}} + \underbrace{f_2(X(t), t)}_{\text{'direct effect'}}.$$

Indirect effect: t 's gain from mimicking $t+m$ (for small m).

$$\begin{aligned} & \text{indirect effect} = 0 && \text{(FOC)} \\ \iff & V'_X(t) = \text{direct effect} && (\boxtimes \text{ formula}). \end{aligned}$$

Problem: 'indirect effect' (hence FOC) ill-defined!

- $f(\cdot, t)$ & X need not be differentiable.
- actions \mathcal{X} need have no convex or topological structure.

The outer first-order condition

Disjuncture: in general, \boxtimes formula $\not\leftrightarrow$ FOC.

- one solution: add strong ‘classical’ assumptions. (slide 18)

The outer first-order condition

Disjuncture: in general, \boxtimes formula $\not\leftrightarrow$ FOC.

- one solution: add strong 'classical' assumptions. (slide 18)
- my solution: find the correct FOC!

The outer first-order condition

Disjuncture: in general, \boxtimes formula $\not\leftrightarrow$ FOC.

- one solution: add strong ‘classical’ assumptions. (slide 18)
- my solution: find the correct FOC!

Decision rule X satisfies the outer FOC iff

$$\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0} = 0 \quad \text{for all } r, t \in (0, 1).$$

Motivation: given decision rule $X : [0, 1] \rightarrow \mathcal{X}$,

- type s can ‘mimic’ $s+m$ by choosing $X(s+m)$.
- oFOC: if types $s \in [r, t]$ do this, it’s collectively unprofitable (to first order).

Housekeeping

Housekeeping lemma. Under classical assump'ns,
oFOC \iff classical FOC.

(sketch proof: slide 19)

Housekeeping

Housekeeping lemma. Under classical assump'ns,
oFOC \iff classical FOC.

(sketch proof: slide 19)

Necessity lemma. Any optimal decision rule X
satisfies oFOC & has $V_X(t) := f(X(t), t)$ absolutely continuous.

(sketch proof: slide 20)

Main theorem

Envelope theorem & converse.

For a decision rule $X : [0, 1] \rightarrow \mathcal{X}$, the following are equivalent:

(1) X satisfies the oFOC

$$\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0} = 0 \quad \text{for all } r, t \in (0, 1),$$

and $V_X(t) := f(X(t), t)$ is absolutely continuous.

(2) X satisfies the \boxtimes formula

$$V_X(t) = V_X(0) + \int_0^t f_2(X(s), s) ds \quad \text{for every } t \in [0, 1].$$

Main theorem

Envelope theorem & converse. For $X : [0, 1] \rightarrow \mathcal{X}$, TFAE:

- (1) X satisfies the oFOC, & $V_X(t) := f(X(t), t)$ is AC.
 - (2) X satisfies the \boxtimes formula.
-

\implies : an envelope theorem.

Implies the MS02 envelope theorem.

\impliedby : *converse* envelope theorem.

The key lemma

Textbook intuition relied on differentiation identity

$$V'_X(s) = \underbrace{\frac{d}{dm} f(X(s+m), s) \Big|_{m=0}}_{\text{'indirect effect'}} + \underbrace{f_2(X(s), s)}_{\text{'direct effect'}}$$

or (integrated & rearranged)

$$\int_r^t \frac{d}{dm} f(X(s+m), s) \Big|_{m=0} ds = V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds.$$

The key lemma

Textbook intuition relied on differentiation identity

$$V'_X(s) = \underbrace{\frac{d}{dm} f(X(s+m), s) \Big|_{m=0}}_{\text{'indirect effect'}} + \underbrace{f_2(X(s), s)}_{\text{'direct effect'}}$$

or (integrated & rearranged)

$$\int_r^t \frac{d}{dm} f(X(s+m), s) \Big|_{m=0} ds = V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds.$$

The 'outer' version is valid:

Identity lemma. If V_X is AC, then

$$\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0} = V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds.$$

(Where both sides are well-defined.)

(sketch proof: slide 21)

(proof of th'm: slide 24)

Application: environment

Agent with preferences $f(y, p, t)$ over outcome $y \in \mathcal{Y}$ and payment $p \in \mathbf{R}$.

- \mathcal{Y} partially ordered
- type $t \in [0, 1]$ is agent's private info
- assume single-crossing.

An *allocation* is $Y : [0, 1] \rightarrow \mathcal{Y}$.

Y is *implementable* iff \exists payment rule $P : [0, 1] \rightarrow \mathbf{R}$
s.t. (Y, P) is incentive-compatible.

Application: goal

Classical result: implementable \iff increasing.

‘ \Leftarrow ’ is the substantial part. Versions: (lit: slide 25)

	literature
outcomes \mathcal{Y}	$\subseteq \mathbf{R}$
preferences f	quasi-linear

Application: goal

Classical result: implementable \iff increasing.

‘ \Leftarrow ’ is the substantial part. Versions: (lit: slide 25)

	literature	this paper
outcomes \mathcal{Y}	$\subseteq \mathbf{R}$	general
preferences f	quasi-linear	general.

Application: result

Implementability theorem. Under regularity assumptions, any increasing allocation is implementable.

Application: result

Implementability theorem. Under regularity assumptions, any increasing allocation is implementable.

Argument:

- fix an increasing allocation $Y : [0, 1] \rightarrow \mathcal{Y}$
- choose a payment rule P so that \boxtimes formula holds

Application: result

Implementability theorem. Under regularity assumptions, any increasing allocation is implementable.

Argument:

- fix an increasing allocation $Y : [0, 1] \rightarrow \mathcal{Y}$
- choose a payment rule P so that \boxtimes formula holds
- then by *converse envelope theorem*, oFOC holds
 \iff mechanism (Y, P) is locally IC.
- finally, local IC \implies global IC by single-crossing.

Application: example

Monopolist selling information.

Outcomes \mathcal{Y} :

distributions of posterior beliefs, ordered by Blackwell.

Application: example

Monopolist selling information.

Outcomes \mathcal{Y} :

distributions of posterior beliefs, ordered by Blackwell.

By the implementability theorem,
any Blackwell-increasing information allocation
can be implemented.

Application: details

Regular \mathcal{Y} : ‘rich’ & ‘not too large’.

(def’n: slide 26)

Examples:

- \mathbf{R}^n ordered by ‘coordinate-wise smaller’
- finite-expectation RVs ordered by ‘a.s. smaller’
- distributions of posteriors updated from a given prior ordered by Blackwell.

Application: details

Regular \mathcal{Y} : ‘rich’ & ‘not too large’.

(def’n: slide 26)

Examples:

- \mathbf{R}^n ordered by ‘coordinate-wise smaller’
- finite-expectation RVs ordered by ‘a.s. smaller’
- distributions of posteriors updated from a given prior ordered by Blackwell.

Regular f :

(def’n: slide 27)

- type derivative f_3 exists, bounded, continuous in p .
- f jointly continuous (when \mathcal{Y} has order topology).

Application: details

Regular \mathcal{Y} : ‘rich’ & ‘not too large’. (def’n: slide 26)

Examples:

- \mathbf{R}^n ordered by ‘coordinate-wise smaller’
- finite-expectation RVs ordered by ‘a.s. smaller’
- distributions of posteriors updated from a given prior ordered by Blackwell.

Regular f : (def’n: slide 27)

- type derivative f_3 exists, bounded, continuous in p .
- f jointly continuous (when \mathcal{Y} has order topology).

Single-crossing f : (def’n: slide 28)

if type t willing to pay to increase $y \in \mathcal{Y}$, then so is type $t' > t$.

Thanks!

Absolute equi-continuity

A family $\{\phi_x\}_{x \in \mathcal{X}}$ of functions $[0, 1] \rightarrow \mathbf{R}$ is *AEC* iff the family

$$\left\{ t \mapsto \sup_{x \in \mathcal{X}} \left| \frac{\phi_x(t+m) - \phi_x(t)}{m} \right| \right\}_{m>0} \text{ is uniformly integrable.}$$

Name inspired by the following (Fitzpatrick & Hunt, 2015):

AC–UI lemma. A continuous $\phi : [0, 1] \rightarrow \mathbf{R}$ is AC iff

$$\left\{ t \mapsto \frac{\phi(t+m) - \phi(t)}{m} \right\}_{m>0} \text{ is uniformly integrable.}$$

As name ‘AEC’ suggests, an AEC family

- is (uniformly) equi-continuous
- has AC functions as its members.

↔ back to slide 3

The classical approach

Classical assumptions:

- \mathcal{X} is a convex subset of \mathbf{R}^n
- action derivative f_1 exists & is bounded
- only Lipschitz continuous decision rules X are considered.

(Bad for applications. Especially the Lipschitz restriction!)

\implies ‘mimicking payoff’ $m \mapsto f(X(t+m), t)$ diff’able a.e.

\implies FOC well-defined, differentiation identity valid.

Thus \boxtimes formula \iff FOC.

\hookleftarrow back to slide 6

Sketch proof of the housekeeping lemma

Housekeeping lemma. Under classical assump'ns,
oFOC \iff classical FOC.

Sketch proof of the housekeeping lemma

Housekeeping lemma. Under classical assump'ns,
oFOC \iff classical FOC.

Sketch proof. Fix a decision rule $X : [0, 1] \rightarrow \mathcal{X}$.

Classical assump'ns & Vitali convergence theorem:

$$\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0} = \int_r^t \frac{d}{dm} f(X(s+m), s) \Big|_{m=0} ds.$$

Sketch proof of the housekeeping lemma

Housekeeping lemma. Under classical assump'ns,
oFOC \iff classical FOC.

Sketch proof. Fix a decision rule $X : [0, 1] \rightarrow \mathcal{X}$.

Classical assump'ns & Vitali convergence theorem:

$$\underbrace{\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0}}_{\substack{= 0 \text{ for all } r, t \\ \text{iff oFOC holds}}} = \int_r^t \frac{d}{dm} f(X(s+m), s) \Big|_{m=0} ds.$$

Sketch proof of the housekeeping lemma

Housekeeping lemma. Under classical assump'ns,
oFOC \iff classical FOC.

Sketch proof. Fix a decision rule $X : [0, 1] \rightarrow \mathcal{X}$.

Classical assump'ns & Vitali convergence theorem:

$$\underbrace{\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0}}_{\substack{= 0 \text{ for all } r, t \\ \text{iff oFOC holds}}} = \underbrace{\int_r^t \frac{d}{dm} f(X(s+m), s) \Big|_{m=0} ds}_{\substack{= 0 \text{ for all } r, t \\ \text{iff classical FOC holds}}}.$$

\hookrightarrow back to slide 7

Sketch proof of the necessity lemma

Necessity lemma. Any optimal decision rule X satisfies the oFOC & has $V_X(t) := f(X(t), t)$ AC.

Sketch proof. X optimal & $\{f(x, \cdot)\}_{x \in \mathcal{X}}$ AEC $\implies V_X$ AC.

Sketch proof of the necessity lemma

Necessity lemma. Any optimal decision rule X satisfies the oFOC & has $V_X(t) := f(X(t), t)$ AC.

Sketch proof. X optimal & $\{f(x, \cdot)\}_{x \in \mathcal{X}}$ AEC $\implies V_X$ AC.

Since X optimal, have for any s and $m > 0 > m'$ that

$$\frac{f(X(s+m), s) - f(X(s), s)}{m} \leq 0 \leq \frac{f(X(s+m'), s) - f(X(s), s)}{m'}.$$

Integrating over (r, t) and letting $m, m' \rightarrow 0$,

both sides (in fact) converge to same limit:

$$\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0} \leq 0 \leq \frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0}. \quad \blacksquare$$

\hookrightarrow back to slide 7

Sketch proof of the identity lemma I

$$\begin{aligned} \text{For } m > 0, & \quad \frac{V_X(t+m) - V_X(t)}{m} \\ &= \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \\ &+ \frac{f(X(t+m), t) - f(X(t), t)}{m} \end{aligned}$$

Sketch proof of the identity lemma I

$$\begin{aligned} \text{For } m > 0, \text{ write} \quad & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = \quad & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + \quad & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

Sketch proof of the identity lemma I

For $m > 0$, write

$$\begin{aligned} & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

$$\lim_{m \downarrow 0} \int_r^t \chi_m = \frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0} \quad \text{if limit exists.}$$

Must show: limit exists & equals

$$V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds.$$

Sketch proof of the identity lemma II

$$\begin{aligned} & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

$\{\psi_m\}_{m>0}$ need not converge a.e. (Even with strong assump'ns.)

But consider $\psi_m^*(t) := \frac{f(X(t), t) - f(X(t), t-m)}{m}$.

Sketch proof of the identity lemma II

$$\begin{aligned} & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

$\{\psi_m\}_{m>0}$ need not converge a.e. (Even with strong assump'ns.)

But consider $\psi_m^*(t) := \frac{f(X(t), t) - f(X(t), t-m)}{m}$.

$\{\psi_m^*\}_{m>0}$ is UI & converges pointwise to $t \mapsto f_2(X(t), t)$. And

$$\begin{aligned} \int_r^t \psi_m &= \int_{r+m}^{t+m} \psi_m^* = \int_r^t \psi_m^* + \left(\int_t^{t+m} \psi_m^* - \int_r^{r+m} \psi_m^* \right) \\ &= \int_r^t \psi_m^* + o(1) \end{aligned} \quad \text{by UI.}$$

Sketch proof of the identity lemma III

$$\begin{aligned} & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

$$\int_r^t \psi_m = \int_r^t \psi_m^* + o(1), \quad \{\psi_m^*\}_{m>0} \text{ UI \& converges pointwise to } t \mapsto f_2(X(t), t).$$

$$V_X \text{ AC} \implies \{\phi_m\}_{m>0} \text{ UI \& converges a.e. to } V_X'.$$

Sketch proof of the identity lemma III

$$\begin{aligned} & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

$$\int_r^t \psi_m = \int_r^t \psi_m^* + o(1), \quad \{\psi_m^*\}_{m>0} \text{ UI \& converges pointwise to } t \mapsto f_2(X(t), t).$$

V_X AC $\implies \{\phi_m\}_{m>0}$ UI & converges a.e. to V_X' . So

$$\lim_{m \downarrow 0} \int_r^t \chi_m = \lim_{m \downarrow 0} \int_r^t [\phi_m - \psi_m] = \lim_{m \downarrow 0} \int_r^t [\phi_m - \psi_m^*]$$

Sketch proof of the identity lemma III

$$\begin{aligned} & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

$$\int_r^t \psi_m = \int_r^t \psi_m^* + o(1), \quad \{\psi_m^*\}_{m>0} \text{ UI \& converges pointwise to } t \mapsto f_2(X(t), t).$$

V_X AC $\implies \{\phi_m\}_{m>0}$ UI & converges a.e. to V_X' . So

$$\begin{aligned} \lim_{m \downarrow 0} \int_r^t \chi_m &= \lim_{m \downarrow 0} \int_r^t [\phi_m - \psi_m] = \lim_{m \downarrow 0} \int_r^t [\phi_m - \psi_m^*] \\ \text{(Vitali)} &= \int_r^t \lim_{m \downarrow 0} [\phi_m - \psi_m^*] \end{aligned}$$

Sketch proof of the identity lemma III

$$\begin{aligned} & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

$$\int_r^t \psi_m = \int_r^t \psi_m^* + o(1), \quad \{\psi_m^*\}_{m>0} \text{ UI \& converges pointwise to } t \mapsto f_2(X(t), t).$$

V_X AC $\implies \{\phi_m\}_{m>0}$ UI & converges a.e. to V'_X . So

$$\begin{aligned} \lim_{m \downarrow 0} \int_r^t \chi_m &= \lim_{m \downarrow 0} \int_r^t [\phi_m - \psi_m] = \lim_{m \downarrow 0} \int_r^t [\phi_m - \psi_m^*] \\ \text{(Vitali)} \quad &= \int_r^t \lim_{m \downarrow 0} [\phi_m - \psi_m^*] = \int_r^t [V'_X(s) - f_2(X(s), s)] ds \end{aligned}$$

Sketch proof of the identity lemma III

$$\begin{aligned} & \left. \frac{V_X(t+m) - V_X(t)}{m} \right\} =: \phi_m(t) \\ = & \left. \frac{f(X(t+m), t+m) - f(X(t+m), t)}{m} \right\} =: \psi_m(t) \\ + & \left. \frac{f(X(t+m), t) - f(X(t), t)}{m} \right\} =: \chi_m(t). \end{aligned}$$

$$\int_r^t \psi_m = \int_r^t \psi_m^* + o(1), \quad \{\psi_m^*\}_{m>0} \text{ UI \& converges pointwise to } t \mapsto f_2(X(t), t).$$

V_X AC $\implies \{\phi_m\}_{m>0}$ UI & converges a.e. to V'_X . So

$$\begin{aligned} \lim_{m \downarrow 0} \int_r^t \chi_m &= \lim_{m \downarrow 0} \int_r^t [\phi_m - \psi_m] = \lim_{m \downarrow 0} \int_r^t [\phi_m - \psi_m^*] \\ \text{(Vitali)} \quad &= \int_r^t \lim_{m \downarrow 0} [\phi_m - \psi_m^*] = \int_r^t [V'_X(s) - f_2(X(s), s)] ds \\ \text{(FToC)} \quad &= V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds. \end{aligned}$$

Proof of the main theorem

Identity lemma. If V_X is AC, then

$$\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0} = V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds.$$

Proof of the main theorem

Identity lemma. If V_X is AC, then

$$\underbrace{\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0}}_{= 0 \text{ for all } r, t} = V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds.$$

iff oFOC holds.

Proof of the main theorem

Identity lemma. If V_X is AC, then

$$\underbrace{\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0}}_{\substack{= 0 \text{ for all } r, t \\ \text{iff oFOC holds.}}} = \underbrace{V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds.}_{\substack{= 0 \text{ for all } r, t \\ \text{iff } \boxtimes \text{ formula holds.}}}$$

Proof of the main theorem

Identity lemma. If V_X is AC, then

$$\underbrace{\left. \frac{d}{dm} \int_r^t f(X(s+m), s) ds \right|_{m=0}}_{\substack{= 0 \text{ for all } r, t \\ \text{iff oFOC holds.}}} = \underbrace{V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds}_{\substack{= 0 \text{ for all } r, t \\ \text{iff } \boxtimes \text{ formula holds.}}}$$

Proof of main theorem. X satisfies the oFOC & V_X is AC
 \implies identity lemma applies. So oFOC \implies \boxtimes formula.

Proof of the main theorem

Identity lemma. If V_X is AC, then

$$\underbrace{\frac{d}{dm} \int_r^t f(X(s+m), s) ds \Big|_{m=0}}_{\substack{= 0 \text{ for all } r, t \\ \text{iff oFOC holds.}}} = \underbrace{V_X(t) - V_X(r) - \int_r^t f_2(X(s), s) ds.}_{\substack{= 0 \text{ for all } r, t \\ \text{iff } \boxtimes \text{ formula holds.}}}$$

Proof of main theorem. X satisfies the oFOC & V_X is AC
 \implies identity lemma applies. So oFOC \implies \boxtimes formula.

X satisfies the \boxtimes formula \implies V_X is AC (by Lebesgue's FToC)
 \implies identity lemma applies. So \boxtimes formula \implies oFOC. ■

Application: existing results

- $\mathcal{Y} \subseteq \mathbf{R}$
 - classical assump'ns $\left\{ \begin{array}{l} \text{Mirrlees (1976), Spence (1974),} \\ \text{Guesnerie and Laffont (1984)} \end{array} \right.$
 - no classical assump'ns Nöldeke and Samuelson (2018)
- general \mathcal{Y}
 - quasi-linear f $\left\{ \begin{array}{l} \text{Matthews and Moore (1987),} \\ \text{García (2005)} \end{array} \right.$
 - general f this paper.

\leftrightarrow back to slide 12

Application: outcome regularity

A set \mathcal{A} partially ordered by \lesssim is

- (1) *order-dense-in-itself* iff for any $a < a'$ in \mathcal{A} , there is a $b \in \mathcal{A}$ such that $a < b < a'$,
 - (2) *chain-separable* iff for each chain $C \subseteq \mathcal{A}$, there is a countable set $B \subseteq \mathcal{A}$ that is order-dense in C ,[‡]
 - (3) *countably chain-complete* iff every countable chain in \mathcal{A} with a lower (upper) bound in \mathcal{A} has an infimum (a supremum) in \mathcal{A} .
- (1) & (2): \mathcal{A} ‘rich’. (3): \mathcal{A} ‘not too large’.

Definition. \mathcal{Y} is *regular* iff it satisfies properties (1)–(3).

↪ back to slide 15

[‡] $B \subseteq \mathcal{A}$ is *order-dense* iff for any $a < a'$ in \mathcal{A} , $\exists b \in B$ s.t. $a \lesssim b \lesssim a'$.

Application: preference regularity

Order topology on a set \mathcal{A} partially ordered by \lesssim :
the topology generated by the open order rays

$$\{b \in \mathcal{A} : b < a\} \quad \text{and} \quad \{b \in \mathcal{A} : a < b\}.$$

Definition. f is *regular* iff

- (a) type derivative f_3 exists & is bounded & continuous in p
- (b) for any chain $\mathcal{C} \subseteq \mathcal{Y}$, f jointly continuous on $\mathcal{C} \times \mathbf{R} \times [0, 1]$
when \mathcal{C} has relative top'gy inherited from order top'gy on \mathcal{Y} .

↔ back to slide 15

Application: single-crossing

Definition. For $\phi : [0, 1] \rightarrow \mathbf{R}$, upper & lower derivatives

$$D^*\phi(t) := \limsup_{m \rightarrow 0} \frac{\phi(t+m) - \phi(t)}{m}$$

$$D_*\phi(t) := \liminf_{m \rightarrow 0} \frac{\phi(t+m) - \phi(t)}{m}.$$

Partial upper/lower derivatives: $(D^*)_i$ & $(D_*)_i$.

Definition. f is *single-crossing* iff

for any increasing $Y : [0, 1] \rightarrow \mathcal{Y}$ & any $P : [0, 1] \rightarrow \mathbf{R}$,
mis-reporting payoff $U(r, t) := f(Y(r), P(r), t)$ satisfies

$$(D^*)_1 U(t, t) \geq 0 \quad \text{implies} \quad (D_*)_1 U(t, t') > 0 \quad \text{for } t' > t$$

$$\text{and } (D_*)_1 U(t, t) \leq 0 \quad \text{implies} \quad (D^*)_1 U(t, t') < 0 \quad \text{for } t' < t.$$
